

IN THE UNITED STATES DISTRICT COURT
FOR THE EASTERN DISTRICT OF PENNSYLVANIA

DIGIMEDIA TECH, LLC,

Plaintiff,

v.

SERVICE ELECTRIC CABLEVISION, INC.,

Defendant.

CIVIL ACTION

NO. 5:23-CV-3541

Jury Trial Demanded

COMPLAINT FOR PATENT INFRINGEMENT

Plaintiff DigiMedia Tech, LLC (“Plaintiff”) files this Complaint for Patent Infringement and states as follows:

THE PARTIES

1. Plaintiff is a limited liability company organized and existing under the laws of the State of Georgia, having its principal office at 44 Milton Avenue, Suite 254, Alpharetta, Georgia 30009.

2. On information and belief, Service Electric Cablevision, Inc. (“Defendant”) is a corporation organized and existing under the laws of the State of Pennsylvania with an established place of business at 4949 Liberty Lane, Suite 400, Allentown, PA 18106.

JURISDICTION AND VENUE

3. This Court has exclusive subject matter jurisdiction over this case pursuant to 28 U.S.C. §§ 1331 and 1338(a) on the grounds that this action arises under the Patent Laws of the United States, 35 U.S.C. § 1 et seq., including, without limitation, 35 U.S.C. §§ 271, 281, 284, and 285.

4. This Court has personal jurisdiction over Defendant on the grounds that Defendant is incorporated in this State.

5. Venue is proper in this Court pursuant to 28 U.S.C. § 1400(b) on the grounds that Defendant resides in this judicial district.

FACTUAL BACKGROUND

The '980 Patent

6. Plaintiff is the owner by assignment of all right, title, and interest in and to United States Patent No. 8,160,980 entitled “Information System Based On Time, Space And Relevance” (“the '980 patent”), including the right to sue for all past, present, and future infringement, which assignment was duly recorded in the USPTO.

7. A true and correct copy of the '980 patent is attached hereto as Exhibit A. The '980 patent is incorporated herein by reference.

8. The application that became the '980 patent was filed on July 11, 2008.

9. The '980 patent issued on April 17, 2012, after a full and fair examination by the USPTO.

10. The '980 patent is and is legally presumed to be valid, enforceable, and directed to patent-eligible subject matter.

11. The elements recited in the claims of the '980 patent were not well-understood, routine, or conventional when the application that became the '980 patent was filed. This is evidenced by the fact that the Patent Examiner allowed the claims of the '980 patent over the art of record.

12. The claims of the '980 patent are directed to technical solutions to the technical problems of both (i) reducing the wait time between requesting common, everyday information and displaying such information to a user and (ii) intelligently generating suggested content for the user from the potentially extensive information based on a user profile. *See Declaration of*

David B. Lett, pp. 17-18 (attached hereto as Exhibit A-1). The claimed invention consists of a new concept, function, and format of delivery that provides a level of ease in accessing common information that prior art systems could not provide, including by providing a proxy that handles the collection and parsing of data, a server that gathers usage data from the client, a data mining cluster that allows for user profiling and time, space and relevance analysis, and a set of channels which are periodically updated and upon which automatic suggestions are given based on the user profile. *Id.*

13. Specifically, for example, claims 5, 7, 8, 9, and 10 of the '980 patent claim:

5. An information system, said information system comprising: at least one client that displays information related to a plurality of information channels; a data mining cluster which performs user profiling and time, space and relevance analysis, wherein suggestions are provided to said at least one client based on a user profile and said time, space, and relevance analysis, and wherein said plurality of information channels are updated based on said suggestions.

7. The system according to claim 5, wherein said at least one client comprises a proxy that collects and parses data.

8. The system according to claim 5, wherein said plurality of information channels are periodically updated.

9. The system according to claim 5, wherein said suggestions are automatically provided to said at least one client.

10. The system according to claim 7, wherein the data collected by the proxy is in extensible markup language (XML) format.

14. The system of asserted claim 5 provides a technical solution to the technical problem of quickly and efficiently providing common information to users. Lett Dec. at pp. 17-18. For example, in one embodiment the “system relies on a local client and a proxy, which can be fully located on the client itself, or rather on a separate server. *Id.* Basic data such as weather forecasts, temperature, news etc. can be displayed to the user. *Id.* By the user's choice of display,

a profile can be constructed which suggests to the user alternative channels that match the user's profile but not the user's current selection” ('980 patent 1:60-67); Lett Dec. at p.18.

15. Dependent claim 7 adds the technical limitation that the at least one client comprises a proxy that collects and parses data.

16. Dependent claim 8 adds the technical limitation that the plurality of information channels are periodically updated.

17. Dependent claim 9 adds the technical limitation that suggestions are automatically provided to the at least one client.

18. Dependent Claim 10 adds the technical limitation that the data collected by the proxy be in extensible markup language (XML) format.

19. The specification of the '980 patent goes on to explain:

The system is a quality of life solution developed in view of residential housing complexes, for supplying information based on time, space and relevance therein. The system is made up of several interdependent subsystems, the client and the supporting infrastructure. The client includes a user-friendly interface and a proxy. The user interface is based in a touch screen placed inside the home to provide quick and easy access to a range of services including the information listed in the former paragraph, and also other functions such as digital photo frame. The proxy pre-fetches information for rapid access. The information provided to the user is based on the user's location and profile. Information is based in channels catalogued in a directory with levels of information and related-location. The usage of the system determines the suggestion of new services to the user.

The supporting infrastructure involves a database collecting information related to the users' usage of the system, a web portal for system administration, and a statistics analyzer to study the information and perform channel suggestions for each user. Additionally, the server can also pre-fetch client information, allowing thin clients with reduced processing power to be used within the proposed system. The database allows analysis of users' usage and to perform profiles leading to suggesting information channels that best fit their profiles.

A portal for system administration is also included allowing the addition, modification or removal of services to/from the system, along with system related parameters, emergency contacts, and location-based events relevant to the user.

The proxy module requests extensible markup language (XML)-based services and converts the provided information to the system format. This allows for seamless integration of different content providers for different information channels. The proxy also registers users' preferences, performs updates of the application and sends statistics to the database. In case of thin clients, the content can be pre-fetched into a server module, named a Content Server, and afterwards requested by the thin client.

The content within the proxy is time, location and user tagged. Information in the information channel is time tagged; the last information retrieved is the most relevant for the moment. When applied, the proxy is also able to fetch information within an information channel related to the client location. Configuration files are used to select the correct parameters to select relevant information within the XML-based service.

Besides XML-based information, the system is also able to fetch and navigate within maps to visualize location based content. The location-based content appears through the usage of a collection of layers that the user can select based in his or her interests.

The system also incorporates automatic updates to seamlessly integrate new functionalities during the course of the system life cycle. Periodically, the proxy checks the web administration portal for updates and system-related information according to the functionalities integrated within the system.

Statistics are collected within the user interface and sent to the proxy. By this tiered process, the system guarantees that statistical information is not lost due to network failure.

The proxy also integrates contacts, to-do lists and calendar functionalities.

For different processing loads, the proxy may reside entirely on the client, or run partially on a server.

The client has a hierarchical way to access information through different depths of information also reflected in Catalogue Directory stored within the Web Administration Portal. In the first information level, the user can find, for example access to information, services, SOS and Maintenance functionalities. SOS allows for fast access to emergency contacts, and maintenance allows for system customization, namely related location,

approval of system services suggestions, themes customization, user identification and screensaver parameters.

Location based information is customized through introduction of the user's location-based reference, namely a landline phone number, a zip code or selection of district, municipality and parish. Moreover, when the screensaver is customized, the system automatically updates media content that will be shown, through the usage of personalized media content service. Upon user's approval of new information channels to be added to the client, the interface is automatically updated to incorporate the suggestions.

For statistical usage, each interaction between the user and the interface is reported to the proxy as an event.

The architecture of the user also uses XML to seamlessly configure the interface and supply relevant information within the interface. This allows for a fast modification of the interface when messages within the platform need to be accommodated.

The Database stores statistics (active/inactive clients, services unavailability, errors, etc).

The database stores users' registrations.

The Web Administration Portal enables addition, modification and removal of new services to be fetched by the proxy and incorporated within the user's interface.

By default, a set of services is integrated within the interface. Afterwards, based in the user's usage of the system further suggestions are performed by the system to the client and submitted for his or her approval.

Emergency contacts and relevant events are also inserted within the Web Administration Portal in order to be fetched by the proxy and shown within the user interface.

Administration statistics are also visualized within the web administration portal.

In the Web Administration Portal, along with the addition, modification and removal of services, the administrator is also able to catalogue each service in a directory, named Catalogue Directory, with levels of information, information related time, user's reference and location-related information. The Catalogue Directory is used within the Statistics

Analyzer to suggest the information channels that best fit the user's profile.

Events performed by the user and stored within the database are analyzed. After analysis, new service suggestions for each user are made and stored within the database for future proxy retrieval.

The process by which the user profile is built and suggestions are made is hereinafter described:

The organization of information in each information channel ("channel") shall be executed based on Interaction Time in each information level. Most used items shall be displayed in greater focus, causing the remaining items to be in lesser focus.

E.g., if Economy News are the most accessed in the News Channel then such item will appear in greater focus than the Neighborhood News, as well as the remainder.

The update of the channel disposition shall be done by a content server when the application is updated.

In the Intelligent Suggestions Channel there are suggestions of content according to the user's profile. The user's profile is defined based on every click of the user in the channels.

The Intelligent Suggestions Channel is defined by the following process:

1—Previous Information Cataloguing

All information related to the user, channels and associated hyperlinks is categorized in a hierarchical way.

The user have access to several categories or associated category hierarchy. Geography is a good example. E.g. a user in "Lisbon", shall implicitly be under "Portugal", which on its hand is under "Europe".

The categorization of the channels and associated hyperlinks can be exemplified again by the News Channel. The user can click on "News" and then click on one of the sub-level, which for example can include "Economics" and "International".

Categorization shall also employ time variables, such as the day of the week on which the click occurred (1-7), if it is a working day, weekend or holiday. It will also employ the date on which the click took place,

decomposing the date in the categories “year”, “month”, “day”, “hour” and “minute”.

2—User Profile Definition

The user profile is obtained resorting to Data Mining Clustering Techniques applied to the interaction records and their categories. Clustering is the partitioning of a data set into subsets (clusters), so that the data in each subset is similar within a parameterized distance. Each cluster that is obtained shall stand for a user profile.

As an example, consider a list of records from 3 users whose identifiers (ID) are 174, 175 and 176. The first record in FIG. 4 is from user 175 and was recorded at Jan. 1, 2007 at 10:12 in the path “News”→“Economics”→“Microeconomics”. This hierarchy is represented by the columns “Pag. Level 1”=1=“News”, “Pag. Level 2”=2=“Economics”, and “Pag. Level 3”=1=“Microeconomics”.

The geographic location of the user is represented in a hierarchical way by “User Space 1”=“Africa”, “User Space 2”=“Angola”, “User Space 3”=“Luanda”. When possible, the information in the channel the user accessed is also geographically categorized; in this example it is done by “Content Space 1”=“Africa”, “Content Space 2”=“Angola”, “Content Space 3”=“Luanda”.

3—Intelligent Suggestions Channel

After defining the Cluster (profile) to which the user belongs, the channels to be suggested to the user are determined by analysis of all the “Pag. Level” categories and Interaction Time.

For each channel path in the cluster a sequence of probabilities is defined in regard to the user being likely to go full depth on a path or not. This allows for a prediction of the probability of the user following a determined hyperlink.

The set of paths for final hyperlinks in a cluster can be represented via a hypergraph. Each cluster record being a hyperedge of the hypergraph. A hypergraph $H=(V,E)$ is a set of vertexes V and a set of hyperedges E , representing a graph extension in which each edge can connect to more than two vertexes.

For example, if $\{p1=“News”, p2=“Economics”, p3=“Microeconomics”\}$ is a record in the cluster, then the hypergraph will include the hyperedge which connects $p1$ to $p2$ and $p3$. Next, a determined weight will be linked

to each hyperedge, calculated from the Page Levels probability, and weighted with Interaction Time.

Finally, to determine the suggestion to be submitted to the user, first the cluster to which the user belongs is identified and then the hyperlink (hyperedge) with the greatest relevance (weight) is suggested. If this hyperlink was already one of the most visited by the user, then the next most relevant hyperlink is selected until it is not one of the most relevant to the user.

Suppose that the bold records in FIG. 4 form a cluster. In order to determine the weights, we first calculate the probability of each hyperedge in the cluster and then multiply it by the average of its interaction times, as presented in FIG. 5.

The hyperedge with higher weight is the suggestion to the user.

In this example, the hyperlink suggested to the user is 2-3-1.

The specific element that determines geo-referenced information may vary from provider to provider. For instance, a good implementation can be achieved through zone codes in some areas. The method by which location is provided can vary.

The exemplary embodiments of the present invention, including the processes described above, can be written as computer programs and can be implemented in general-use digital computers that execute the programs using a computer readable recording medium and other types of transmission media. Examples of the computer readable recording medium include magnetic storage media (e.g., ROM, floppy disks, hard disks, etc.), and optical recording media (e.g., CD-ROMs, or DVDs). Other types of transmission media can include carrier waves (e.g., transmission through the Internet).

The foregoing embodiments are merely exemplary and are not to be construed as limiting the present invention. The present teaching can be readily applied to other types of apparatuses.

'980 patent, 2:30-5:59.

20. Figure 4 of the '980 patent, described in the passage above, shows:

Year	Month	Day	Hour	Minutes	Userid	Pag. Level 1	Pag. Level 2	Pag. Level 3	Interaction Time	User Space 1	User Space 2	User Space 3	Content Space 1	Content Space 2	Content Space 3
2007	1	1	10	12	175	1	2	1	1	Africa	Angola	Luanda	Africa	Angola	Luanda
2007	1	1	15	10	176	1	2	3	2	Europe	England	London	Europe	England	London
2007	1	2	16	0	174	2	0	0	1	Europe	Portugal	Lisbon	Europe	Portugal	Lisbon
2007	3	10	11	5	176	2	3	0	1	Europe	England	London			
2007	3	10	16	50	174	2	3	1	3	Europe	Portugal	Lisbon	Europe	Portugal	Lisbon
2007	2	15	20	41	175	2	3	1	2	Africa	Angola	Luanda			
2007	3	10	12	15	176	2	3	1	2	Europe	Portugal	Lisbon	Europe	England	London
2007	4	5	13	10	175	2	3	3	3	Europe	Portugal	Porto			
2007	4	10	12	0	176	2	3	3	1	Europe	Portugal	Lisbon			
2007	3	10	17	15	174	2	3	4	2	Europe	Portugal	Lisbon	Europe	Portugal	Lisbon
2007	3	10	17	20	174	2	3	5	3	Europe	Portugal	Lisbon			
2007	4	5	13	12	175	3	3	2	1	Europe	England	London	Europe	England	London

Figure 4

21. Figure 5 of the '980 patent, described in the passage above, shows:

Pag. Level 1	Pag. Level 2	Pag. Level 3	Probability	average interaction time	Weight
2	3	0	10%	1	10%
2	3	1	30%	2.33	70%
3	3	2	1%	1	1%
2	3	3	20%	2	40%
2	3	4	10%	2	20%
2	3	5	10%	3	30%

Figure 5

22. This combination of functional components and limitations set forth in the asserted claims constitutes patent-eligible subject matter, are not directed to an abstract idea, law of nature, or natural phenomenon, and contains one or more technical, inventive concepts for accomplishing the goal of quickly and efficiently providing common information to users without unnecessary delay, and providing suggested additional information based on a user's profile. Lett Dec., p. 17-18.

23. The combination of functional components and limitations set forth in the asserted claims of the '980 patent was not well-understood, routine, or conventional at the time of the invention. Lett Dec., p.18-19. This is also evidenced by the decision by the Patent Examiner to allow the asserted claims over the art of record.

24. DigiMedia’s technical expert, David B. Lett, has opined that, based on his education, training, and experience, the ’980 patent is directed to patent-eligible subject matter under the U.S. Supreme Court’s *Alice* framework. Declaration of David B. Lett, pp. 17-23.

25. With regard to step one of the *Alice* analysis, in Mr. Lett’s expert opinion,

the claims of the ’980 Patent in their entirety, the character of these claims as a whole is not directed to excluded subject matter, such as an abstract idea. While the claims might be dissected to identify individual abstract ideas within them, I understand that such dissection is improper. Here, the claims are directed to an improvement in the functioning of prior art computer systems that uses a proxy and a data mining cluster, both of which are specifically described in detail in the ’980 Patent’s written description. Moreover, it is my expert opinion that, even if, for the sake of argument, the claims are considered to involve patent-ineligible concepts like abstract ideas, the claims as a whole do not attempt to monopolize the entirety of any patent ineligible concept.

Importantly, the patent examiner did not identify any patent eligibility issues during the prosecution of the ’980 Patent. Instead, the examiner merely required that the claims be rewritten to include certain elements from certain proposed claims and noted that the prior art of record “neither anticipated nor rendered obvious” those elements. The patentee satisfied the examiner by amending the claims to include the data mining cluster element in all independent claims. The patent issued with no issues whatsoever raised about the eligibility of the claims under Section 101.

... The claims of the ’980 Patent all specifically require a data mining cluster, a claim element that was added to all the independent claims in response to the examiner’s office action and that the examiner found was not anticipated or rendered obvious by the prior art of record. This data mining cluster is described at length in the patent, and for example in claim 1 allows for user profiling and time, space and relevance analysis. By implementing the data mining cluster as specifically described in the patent, the claims of the ’980 Patent do, in fact, articulate a specific technological improvement in the provision of information to a user. This is a technical solution to a technical problem, and the patent is not merely a “do-it-on-a-computer” patent.

As a result, it is my opinion that the claims, considered as a whole and in light of the specification and file history, are not directed to

an abstract idea, but rather are directed to a specific sequence of steps and specifically identified and described components that improve the functionality of a specific type of computer system. Thus, it is my opinion that the claims of the '980 Patent satisfy Alice step one and are not directed to any excluded subject matter.

Lett Dec. pp. 19-21.

26. Moving to step two of the *Alice* analysis, Mr. Lett opined that

Even if the claims of the '980 Patent could be considered to be directed to patent-ineligible subject matter, it is my opinion that the claims would nonetheless remain patentable because analyzing the elements of the claims individually *and* as an ordered combination shows that the claims form an inventive concept that amounts in practice to more than a patent on any ineligible concept itself. Specifically, the inventive concept embodied in the '980 Patent's claims is more than the mere application of an abstract idea using well-understood, routine, and conventional activities.

The file history of the '980 Patent proves this point. The examiner expressly found that the elements added to the originally rejected claims were not anticipated or rendered obvious by the prior art of record. In my opinion, if claim elements are not anticipated or rendered obvious by the prior art, they cannot be well understood, routine, or conventional.

Moreover, the examiner's determination that the claims as amended and issued were patentable indicates that the claims included unconventional steps. It is my opinion that the claims as a whole do, in fact, include unconventional steps in an ordered combination that confine the claims to a particular, useful application of any potentially ineligible concept, and improve prior computer technology.

Further, even if the claims of the '980 Patent are considered to include known, conventional elements, reading the claims as a whole and read in light of the specification and file history, the claims involve the non-conventional and non-generic arrangement of known conventional elements.

[The New York Court's] Order asserts that the patent does not explain how the claimed improvements to a user's experience are a product of any particular technological innovation. Order at 22. Again, I must respectfully disagree with the Court's Order. First, I understand that the accused infringer must establish patent ineligibility by clear and convincing evidence, and it appears the

Court did not apply that burden of proof in its analysis. Second, the '980 Patent does, in fact, explain to a skilled artisan how the claimed invention accomplishes the benefits to the user experience. This description can be found in the specification's description of the claimed data mining cluster and proxy elements outlined above. The Order appears to have been confused by the fact that the programs implementing the claimed invention can be run on general purpose computers. However, computer programs constitute the embodiments of the claimed invention, not the general purpose computer components on which the embodying programs run. See '980 Patent 5:45-49.

For the foregoing reasons, it is my opinion that the claims of the '980 Patent satisfy step two of the *Alice* analytical framework for determining patent eligibility, and form an inventive concept that amounts in practice to more than a patent on any ineligible concept itself.

Lett Dec., pp. 19-23.

27. The expert opinions of Mr. Lett, which are hereby incorporated herein by reference and attached hereto as Exhibit A-1, establish the patentability of the '980 patent as a factual matter. At a minimum, Mr. Lett's expert declaration creates an issue of fact concerning step two of the *Alice* framework by showing, as a factual matter, that the claims of the '980 patent contain an inventive concept that amounts in practice to more than a patent on any ineligible concept.

28. In addition, the significance of the inventiveness of the '980 patent is illustrated by the fact that it has been cited in 11 other patent applications, including the following U.S. patents and published patent applications: US8488011B2, US8493353B2, US9064326B1, US9430876B1, US10341459B2, US8539369B2, US9501140B2, and US20140164404A1. These public documents and their related prosecution histories are incorporated herein by reference and provide concrete proof that the inventions claimed and disclosed in the '980 patent were not well-understood, routine, or conventional at the time of the invention.

The '778 Patent

29. Plaintiff is the owner by assignment of all right, title, and interest in and to United States Patent No. 7,065,778 entitled “Method and System for Providing Media from Remote Locations to a Viewer” (“the ’778 patent”), including the right to sue for all past, present, and future infringement, which assignment was duly recorded in the USPTO.

30. A true and correct copy of the ’778 patent is attached hereto as Exhibit B. The ’778 patent is incorporated herein by reference.

31. The application that became the ’778 patent was filed on May 25, 2001.

32. The ’778 patent issued on June 20, 2006, after a full and fair examination by the USPTO.

33. The ’778 patent is and is legally presumed to be valid, enforceable, and directed to patent-eligible subject matter.

34. The ’778 patent discloses and claims technical solutions to technical problems and thus provides technical benefits. For example, the ’778 patent discloses that

Modern research and technology have provided society with a wide variety of electronic devices. It is appreciated that some of these modern electronic devices are very powerful and useful to their users. (1:15-18)

35. As also disclosed in Plaintiff’s ’778 patent:

It is appreciated that television programming is distributed to televisions of the general public in a wide variety of ways. For example, consumers of the general public are able to receive television programming on their televisions within their households and/or businesses via coaxial cables, personal satellite dishes (large or small), antennas, broadband Internet, and the like. Furthermore, most of these ways of distributing television programming provide the general public an ever increasing amount of television programming. (1:38-47)

36. As further disclosed in Plaintiff’s ’778 patent:

[C]urrently there may be as many as one hundred times more television channels that are basically providing nationwide television programming. Furthermore, it is appreciated that some

of these television channels are continuously broadcasting television programming 24 hours a day (e.g., ESPN, VH1, CNN, QVC, and the like). Consequently, there is a large amount of television programming available to consumers of the general public. (1:51-58)

37. Plaintiff's '778 patent additionally discloses

However, it should be appreciated that there are some disadvantages associated with the distribution of television programming. For instance, one of the disadvantages is that a typical television viewer does not have access to all of the television programming that is broadcast throughout the world. Therefore, the typical television viewer is unable to view television programming that he or she would be interested in viewing because it is being broadcast in remote cities, states, and/or countries.

Accordingly, a need exists for a method and system which enables television viewers to receive desired television programming which is broadcast in remote locations throughout the world. The present invention provides a method and system which accomplishes the above mentioned need. (1:59-2:8)

38. The elements recited in the claims of the '778 patent were not well-understood, routine, or conventional when the application that became the '778 patent was filed. This is evidenced, for example, by the fact that the Patent Examiner allowed the '778 patent over the art of record.

39. The claims for the '778 patent are directed to technical solutions to the technical problem of television content distribution desired by requesting users, where the information content is in remote locations throughout the world – in other words, of enabling television viewers to receive programming regardless of where it is broadcast. One of the reasons this is important is that a user is often remote to the broadcast location and/or is unable to view the desired program at the time it airs. This problem calls for technical solutions. The '778 patent discloses and claims such technical solutions. For example, the '778 patent recognized that a series of receiver devices, servers and digital recorders could be put in place. Such methods and

systems could then be used to locate the appropriate digital recorders, provide the necessary instructions, and set forth a method to record and provide access to the user after the recording is complete.

40. In one embodiment, for example, the invention disclosed and claimed in the '778 patent

enables a user to utilize a personalized video recorder (PVR) to order and receive specific television shows that are unavailable from his or her television content provider. Specifically, the personalized video recorder is coupled to the Internet such that it can receive an electronic programming guide (EPG) containing worldwide television programming from an EPG server computer. The personalized video recorder user is able to utilize the EPG to request delivery of a specific television show that is unavailable to him or her. Upon reception of the request, the EPG server computer locates via the Internet one or more personalized video recorders situated within a broadcast region of the requested television show. Next, the EPG server computer programs one or more personalized video recorders to record the requested television show when it is broadcast. Once the personalized video recorders record the television show, one or more of the personalized video recorders may transmit it to the EPG server computer which then transmits it to the requesting personalized video recorder. (2:9-28)

41. Specifically, for example, asserted claims 31, 32, 33, and 37 of the '778 patent claim:

31. A method comprising:

a server computer receiving a request from a receiver device for a television show;

said server computer locating a plurality of digital video recorders capable of receiving a broadcast of said television show that satisfies said request;

each of said plurality of digital video recorders receiving a programming instruction from said server computer to record said television show when broadcast by a television content provider, after said server computer locating said plurality of digital video recorders;

at least one of said plurality of digital video recorders recording said television show during broadcast of said television show by said television content provider, after said each of said plurality of digital video recorders receiving said programming instruction; and

said receiver device receiving said television show recorded by said at least one of said plurality of digital video recorders.

32. The method as described in claim 31 further comprising each of said plurality of digital video recorders adding said programming instruction to its programmable task list.

33. The method as described in claim 31 further comprising said receiver device receiving an electronic programming guide from said server computer.

37. The method as described in claim 31 further comprising: a cache server computer receiving and storing said television show recorded by said at least one of said plurality of digital video recorders; and said cache server transmitting a first copy of said television show to said receiver device.

42. The inventions recited in the asserted claim of the '778 patent, including their sequence of steps, provides a technical solution to the technical problem of remote television content distribution and recording.

43. The claimed inventions constitute patent-eligible subject matter, are not directed to an abstract idea, law of nature, or natural phenomenon, and contain one or more inventive concepts for accomplishing the goal of providing remote television distribution and content access through a series of receivers, servers, and recording devices.

44. The significance of the inventiveness of the '778 patent is illustrated by the fact that it has been cited in 77 other patent applications, including the following U.S. patents and published patent applications: US20030235396A1, US20030235395A1, US20040078810A1, US20040101271A1, US20040101272A1, US20040117853A1, US20040117849A1, US20040117846A1, US20040117829A1, US20040117833A1, US20040114036A1,

US20040117851A1, US20040117837A1, US20040117816A1, US20040117491A1, US20040117844A1, US20040117852A1, US20040114141A1, US20040117836A1, US20040117845A1, US20040117848A1, US20040128680A1, US20040148353A1, US20050108519A1, US20050233693A1, US20060080452A1, US20060127039A1, US20060184969A1, US20060230173A1, US20070086724A1, US20070207755A1, US20070280631A1, US20070286581A1, US20080089667A1, US20080092200A1, US20080089658A1, US20080138028A1, US20080172688A1, US20080232783A1, US20090010610A1, US20090044233A1, US20090064266A1, US20090083836A1, US20090138928A1, US20090157803A1, US20090182945A1, US20090313657A1, US20100070925A1, US20100169939A1, US20100251318A1, US20100250772A1, US20100269140A1, US20110191811A1, US20110296466A1, US20130132994A1, US9602862B2, US20150067103A1, US10306331B2, and US20200053319A1. These public documents and their related prosecution histories are incorporated herein by reference and provide concrete proof that the inventions claimed and disclosed in the '778 patent were not well-understood, routine, or conventional at the time of the invention.

The '220 Patent

45. Plaintiff is the owner by assignment of all right, title, and interest in and to United States Patent No. 6,684,220 entitled “Method and System for Automatic Information Exchange” (“the '220 patent”), including the right to sue for all past, present, and future infringement, which assignment was duly recorded in the USPTO.

46. A true and correct copy of the '220 patent is attached hereto as Exhibit C. The '220 patent is incorporated herein by reference.

47. The application that became the '220 patent was filed on September 20, 2000.

48. The '220 patent issued on January 27, 2004, after a full and fair examination by the USPTO.

49. The '220 patent is and is legally presumed to be valid, enforceable and directed to patent eligible subject matter.

50. The elements recited in the asserted claims of the '220 patent were not well-understood, routine, or conventional when the application that became the '220 patent was filed. This is demonstrated, for example, by the decision of the Patent Examiner to allow the claims of the '220 patent over the art of record.

51. The claims the '220 patent are directed to technical solutions to the technical problem of a server system conducting automated information exchanges. One of the reasons this is important is to support automated and accurate server-generated responses to customer inquiries in online chat systems. With accurate and automated information exchange, routine customer inquiries can be answered directly by a server system. The '220 patent discloses and claims such technical solutions for automated information exchange. For example, the '220 patent couples an information source to a processor that stores a data model. The '220 patent discloses a loading engine for automatically creating object links between input variables and output variables for the data objects in the data model. Consequently, the technology in the '220 patent enables automated and accurate online responses from a server system to customer support inquiries without requiring answers from customer support representatives.

52. For example, asserted claim 10 of the '220 patent claims:

10. A method for automatic information exchange, comprising:

retrieving a model from an information source, the model having a plurality of objects, each of the plurality of objects having an input variable and an output variable;

automatically identifying the input variables and the output variables of each of the plurality of objects; and

automatically creating object links between the corresponding input variables and output variables of each of the plurality of objects.

53. The sequence of steps set forth in the asserted claim of the '220 patent provide a technical solution to the technical problem of a server system conducting automated information.

54. The claimed sequence of steps set forth in the '220 patent constitutes patent-eligible subject matter, is not directed to an abstract idea, law of nature, or natural phenomenon, and contains one or more inventive concepts for accomplishing the goal of accurate and automated information exchange.

55. The significance of the inventiveness of the '220 patent is illustrated by the fact that it has been cited in six other patent applications, including the following U.S. patents and published patent applications: US20060010423A1, US20060010419A1, US20060136497A1, EP1674953A1, and US20140373034A1. These public documents and their related prosecution histories are incorporated herein by reference and provide concrete proof that the inventions claimed and disclosed in the '220 patent were not well-understood, routine, or conventional at the time of the invention.

COUNT I – INFRINGEMENT OF THE '980 PATENT

56. Plaintiff realleges and incorporates by reference the allegations set forth above, as if set forth verbatim herein.

57. Plaintiff provided Defendant with notice of its infringement of the '980 patent by letter dated June 29, 2023.

58. Defendant has been and is now making, using, selling, offering for sale, and/or importing products that incorporate one or more of the inventions claimed in the '980 patent and/or inducing third parties (e.g., end users) to offer, sell, or use products in their customary and

intended manner that Defendant knows to infringe the '980 patent (including, for example, by using Defendant's mobile apps for streaming TV).

59. For example, Defendant infringes at least claims 5, 7, 8, 9, and 10 of the '980 patent, either literally or under the doctrine of equivalents, in connection with Defendant's mobile apps for streaming TV, as detailed in the preliminary claim chart attached hereto as Exhibit D and incorporated herein by reference.

60. Defendant's infringing activities are and have been without authority or license under the '980 patent.

61. On information and belief, Defendant continued its infringing conduct after receiving notice of its infringement. Defendant's infringement after receiving the June 29, 2023, letter has been willful.

62. Plaintiff has been damaged by Defendant's infringement of the '980 patent, and Plaintiff is entitled to recover damages for Defendant's infringement, which damages cannot be less than a reasonable royalty. Moreover, Plaintiff should be awarded enhanced damages for Defendant's willful infringement.

COUNT II – INFRINGEMENT OF THE '778 PATENT

63. Plaintiff realleges and incorporates by reference the allegations set forth above, as if set forth verbatim herein.

64. Defendant has made, used, sold, offered for sale, and/or imported products that incorporate one or more of the inventions claimed in the '778 patent.

65. For example, Defendant has infringed at least claims 31, 32, 33, and 37 of the '778 patent, either literally or under the doctrine of equivalents, in connection with Defendant's Cloud DVR service, as detailed in the preliminary claim chart attached hereto as Exhibit E and incorporated herein by reference.

66. Defendant's infringing activities occurred without authority or license under the '778 patent.

67. Plaintiff has been damaged by Defendant's infringement of the '778 patent, and Plaintiff is entitled to recover damages for Defendant's infringement, which damages cannot be less than a reasonable royalty.

COUNT III – INFRINGEMENT OF THE '220 PATENT

68. Plaintiff realleges and incorporates by reference the allegations set forth above, as if set forth verbatim herein.

69. Defendant has made, used, sold, offered for sale, and/or imported products that incorporate one or more of the inventions claimed in the '220 patent.

70. For example, Defendant has infringed at least claim 10 of the '220 patent, either literally or under the doctrine of equivalents, in connection with Defendant's customer support chatbot system, as detailed in the preliminary claim chart attached hereto as Exhibit F and incorporated herein by reference.

71. Defendant's infringing activities occurred without authority or license under the '220 patent.

72. Plaintiff has been damaged by Defendant's infringement of the '220 patent, and Plaintiff is entitled to recover damages for Defendant's infringement, which damages cannot be less than a reasonable royalty.

JURY DEMAND

Plaintiff demands a trial by jury of all issues so triable.

PRAYER FOR RELIEF

Plaintiff respectfully requests that the Court find in its favor and against Defendant, and that the Court grant Plaintiff the following relief:

- A. Entry of judgment that Defendant has infringed one or more claims of the '980 patent,
- B. Entry of judgment that Defendant has infringed one or more claims of the '778 patent,
- C. Entry of judgment that Defendant has infringed one or more claims of the '220 patent,
- D. Damages in an amount to be determined at trial for Defendant's infringement, which amount cannot be less than a reasonable royalty, and an accounting of all infringing acts including, but not limited to, those acts not presented at trial, along with enhanced damages for Defendant's willful infringement of the '980 patent;
- E. An award of attorney's fees pursuant to 35 U.S.C. § 285,
- F. All costs of this action,
- G. Pre-judgment and post-judgment interest on the damages assessed, and
- H. Such other and further relief, both at law and in equity, to which Plaintiff may be entitled and which the Court deems just and proper.

This 12th day of September, 2023.
